

ABSTRACT

Debi Puji Utari. 2018. Reducing Hyperactive Behavior in Children with Mild Impotence Through Gradi V by Extinction Technique in SLBN 1 Pariaman. Mini Thesis. Faculty of Educational Science. State University of Padang.

This research is motivated by the existence of hyperactive behavior in a child so that a study appears entitled "Reducing Hyperactive Behavior in Children with Mild Impotence Through Extinction Technique".

The research was conducted at SLBN 1 Pariaman with children or subjects who sat in class V. Interventions were given for 17 meetings. The technique used is extinction which means removing the amplifier from the behavior you want to eliminate by recording using duration.

The results of this study indicate that extinction techniques are proven to reduce hyperactive behavior in mild mentally retarded children seen from the results of analysis of children in the second baseline condition that the duration of hyperactive behavior in children such as excessive talking, running, and pacing decreases over time.

Keyword: mental retardation, hyperactive behavior, extinction
